-!- FUNCTION: BINDS TO TIEZ RECEPTOR AND CCUNTERACTS ELOOD VESSEL
MATURATION/STABILITY MEDIATED BY ANGIOPOIETIN-1. ITS FUNCTION MAY
BE CONTEXT-DEPENDENT. IN THE ABSENCE OF ANGIOGENIC INDUCERS, SUCH
AS VEGF, ANG2-MEDIATED LOOSENING OF CELL-MATRIX CONTACTS MAY
INDUCE ENDOTHELIAL CELL APOPTOSIS WITH CONSEQUENT VASCULAR
REGRESSION. IN CONCERT WITH VEGF, IT MAY FACILITATE ENDOTHELIAL
CELL MIGRATION AND PROLIFERATION, THUS SERVING AS A PERMISSIVE
CHANGICGENIC SIGNAL.
-!- SUBCELLULAR LOCATION: Secreted.
-!- SUBCELLULAR LOCATION: Secreted.
-!- SUBCELLULAR CONTAINS I fibrinogen C-terminal domain.

Mendriota S.J., Pepper M.S.;

"Regulation of anglopoletin-2 mRNA levels in bovine microvascular endothelial cells by cytckines and hypoxia.";

Circ. Res. 83:852-859(1998).

-!- FUNCTION: BINDS TO TIE2 RECEPTCR AND COUNTERACTS BLOOD VESSEL MATURATION/STABILITY MEDIATED BY ANGIOPOLETIN-1. ITS FUNCTION MAY BE CONTEXT-DEPENDENT. IN THE ABSENCE OF ANGIOGENIC INDUCERS, SUCH AS VEGF, ANG2-MEDIATED LOOSENING OF CELL-MATRIX CONTACTS MAY INDUCE BENDOTHELIAL CELL APOPTOSIS WITH CONSCOURNT VASCULAR REGRESSION. IN CONCERT WITH VEGF, IT MAY FACILITATE ENDOTHELIAL CELL ALGORNEL CONSCOURNT VASCULAR LOCATION. Secreted.

-!- SUBCELLULAR LOCATION: Secreted.

-!- SUBCELLULAR STAGE: FOUND TO BE EXPRESSED THROUGHOUT THE OVARIAN CYCLE. OVEREXPRESSED DURING LUTEOLYSIS, THIS COULD REFLECT THE REGRESSION OF CAPILLARIES THAT HAD DEVELOPED PERICYTE CONTACT IN THE MIDSTAGE CORPUS LUTEUM.

-!- SIMILARITY: CONTAINS 1 fibrinogen C-terminal domain.
                4.

Redulation of angiopoietin-2 mRNA levels in bovine microvascular canditional acils by cytokines and hypoxia.";

Circ. Res. 33:852-859(1996).

Circ. Res. BINDS AND ACTIVATES TIEZ RECEPTOR BY INDUCING ITS TYROSINE PHOSPHORYLATION. IMPLICATED IN ENDOTHELIAL DEVELOPMENTAL PROCESSES LATER AND DISTINCT FROM THAT OF VEGF. APPEARS TO PLAY A CRUCIAL ROLE IN MEDIATING RECIPROCAL INTERACTIONS BETWEEN THE ENDOTHELIUM AND SURROUNDING MATRIX AND MESENCHYME. MEDIATES BLOOD VESSEL MATURATION/STABILITY. IT MAY PLAY AN IMPORTANT ROLE IN THE HEART EARLY DEVELOPMENT.

CC. !- SUBCELLULAR LOCATION: Secreted.

CC. !- SIMILARITY: Contains 1 fibrinogen C-terminal domain.

CC. !- SIMILARITY: Contains 1 fibrinogen collaboration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This SWISS-PROT entry is copyright.                                                                                                                                                                                                                                                                                                                            ()
()
                                                                                                                                                This is the amino acid sequence of human prothrombinase Fgl2, as predicted from hfgl2 DNA (see AAV84139). Fgl2 is a 70 kDa transmembrane serine protease that has immune procoagulant activity. The invention provides a method for inhibiting immune coagulation by inhibiting the activity or expression of Fgl2. The method can be seed in vivo to treat a condition which requires a reduction in second coagulation such as bacterial and viral infections, cancer, glomerulonephritis, a number of gastrointestinal diseases, allograft and xenograft rejection and foetal loss. An Fgl2-specific antibody, an Fgl2 antisense oligonucleotide, or a substance that a ffects prothrombinase activity of a Fgl2 protein may be used to treat a condition requiring a reduction in proceagulant activity. A vaccine containing an Fgl2 protein or peptide is used for prevention of graft rejection or foetal loss (claimed).

This is the amino acid sequence of mouse prothrombinase Fgl2, as predicted from fgl2 DNA (see AAV84140). Fgl2 is a 70 kDa transmembrane serine protease that has immune procoagulant activity. The human Fgl2 amino acid sequence is given in AAW86236. The invention provides a method for inhibiting immune coagulation by inhibiting the activity or expression of Fgl2. The method can be used in vivo to treat a condition which requires a reduction in immune coagulation such as bacterial and viral infections, cancer, glomerulonephritis, a number of gastrointestinal diseases, allograft and xenograft rejection and foetal loss. An Fgl2-specific antibody, an Fgl2 antisense oligonucleotide, or a substance that affects prothrombinase activity of a Fgl2 protein may be used to treat a condition requiring a reduction in procoagulant activity. A vaccine containing an Fgl2 protein or peptide is used for prevention of graft rejection or foetal loss (claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

AAR94605 is a human TIE-2 (hTIE-2) ligand 2 derived from a pBluescript KS clone. hTIE-2 ligand DNAs of the invention are recombinant versions of the native ligand coding sequences and may be used to produce the ligands at a high yield. Antibodies and receptor bodies that bind to TIE-2 ligands may be used to inhibit angiogenesis and neovascularisation of e.g. associated with tumour development) and the TIE-2 ligands themselves are useful to promote neovascularisation and wound healing e.g. for treatment of ischaemia. TIE-2 ligands are also useful to treat thromboembolytic disease, atherosclerosis, inflammation and diabetes. Ligand bodies contg. TIE-2 ligands may also be useful for the delivery and targeting of growth factors, toxins etc. to sites where their presence is advantageous.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         METWGGGWTVLQARLDGSTNFTRTWODYKAGFGNLRREFWLGNDKIHLLTKSKEMILRID
